

## PROJECT PROFILE

**PROJECT:** Concorde Hangar Floor  
**LOCATION:** United Kingdom

### THE PROBLEM

This hangar is where the British And French fleets of Concorde's are maintained and serviced.

Inside the hangar is a great deal of hi-tech equipment. The hangar was in need of refurbishment because it was suffering from poor light reflection and an accumulation of dust on the floor which was proving difficult to remove.

### THE SOLUTION

Six companies were requested to apply samples of their coatings which needed to resist Skydrol, give good light reflection, a good aesthetic appearance and be suitable for the movement of Concordes, 747's and aircraft moving vehicles.

Over a six month evaluation period, the coatings were evaluated with the Floor-Tech HB system proving to be the best.

The area protected totalled over 3,400m<sup>2</sup> and the hangar manager was extremely pleased with the finished application.
